Introduction to AI

AI enables us to build amazing software that can improve health care, enable people to overcome physical disadvantages, empower smart infrastructure, create incredible entertainment experiences, and even save the planet!

<https://www.microsoft.com/en-us/videoplayer/embed/RE4vyDI?postJsllMsg=true>

What is AI

Artificial intelligence is an intelligence that was developed in the form some mathematical operations and implemented using computer programming in order to make machines behaves like human intelligence to perform some task like

- Decision making
- Language translation
- Visual perceptions
- Speech recognition etc.

Key Elements of AI

Machine learning - This is often the foundation for an AI system, and is the way we "teach" a computer model to make prediction and draw conclusions from data.

Anomaly detection - The capability to automatically detect errors or unusual activity in a system.

Computer vision - The capability of software to interpret the world visually through cameras, video, and images.

Natural language processing - The capability for a computer to interpret written or spoken language, and respond in kind.

Conversational AI - The capability of a software "agent" to participate in a conversation.

Knowledge mining - The capability to extract information from large volumes of often unstructured data to create a searchable knowledge store.

Fuzzy Logic Systems - Mimics Human Decision Making

Swarm Intelligence – **Swarm intelligence** (SI) is an **artificial intelligence** approach which is inspired by natural behavior to solve optimization problems.

Understand machine learning

Machine Learning is the foundation for most AI solutions.

Sustainable farming techniques are essential to maximize food production while protecting a fragile environment. *The Yield*, an agricultural technology company based in Australia, uses sensors, data and machine learning to help farmers make informed decisions related to weather, soil and plant conditions.

Machine learning in Microsoft Azure

Microsoft Azure provides the **Azure Machine Learning** service - a cloud-based platform for creating, managing, and publishing machine learning models.

Automated machine learning

Azure Machine Learning designer

Data and compute management

Pipelines

What is Azure Machine Learning studio?

Training and deploying an effective machine learning model involves a lot of work, much of it time-consuming and resource-intensive

Azure Machine Learning is a cloud-based service that helps simplify some of the tasks it takes to prepare data, train a model, and deploy a predictive service.

Azure Machine Learning helps data scientists increase their efficiency by automating many of the time-consuming tasks associated with training models

it enables data scientists to use cloud-based compute resources that scale effectively to handle large volumes of data while incurring costs only when actually used.

Azure Machine Learning Studio

Azure Machine Learning studio is a web portal for machine learning solutions in Azure. It includes a wide range of features and capabilities that help data scientists prepare data, train models, publish predictive services, and monitor their usage.

The screenshot displays the Microsoft Azure Machine Learning Studio web portal. The interface features a blue header bar with the title "Microsoft Azure Machine Learning Studio". On the left, a sidebar menu lists various navigation options: "Microsoft", "New", "Home" (selected), "Author" (Notebooks, Automated ML, Designer), "Assets" (Data, Jobs, Components, Pipelines, Environments, Models, Endpoints), and "Manage" (Compute, Datastores, Linked Services, Data Labeling). The main content area is titled "Welcome to the Azure Machine Learning Studio" and contains four large cards: "Create new" (with a plus icon), "Notebooks" (with a document icon), "Automated ML" (with a lightning bolt icon), and "Designer" (with a flowchart icon). Each card includes a brief description and a "Start now" button. Below these cards, a section titled "Recent resources" shows a table with tabs for "Jobs", "Compute", "Models", and "Data". The "Jobs" tab is active, displaying a table with columns: "Display name", "☆", "Experiment", "Status", "Logs", "Submitted time", "Submitte...", and "Job type".

Azure Machine Learning compute

At its core, Azure Machine Learning is a service for training and managing machine learning models, for which you need compute on which to run the training process.

- **Compute Instances**
- **Compute Clusters**
- **Inference Clusters**
- **Attached Compute**

Compute Instance

Azure Machine Learning compute instance is a virtual machine on which you are running a notebook.

Development workstations that data scientists can use to work with data and models.

Compute Clusters

Scalable clusters of virtual machines for on-demand processing of experiment code.

- Cost-effective way to run experiments that need to handle large volumes of data
- Reduce time for parallel processing to distribute the workload

Attached Compute

Links to existing Azure compute resources, such as Virtual Machines or Azure Databricks clusters.

Easily attach the existing Azure Machine Learning workspace and use it as a compute target for certain workload types.

Inference Clusters

Deployment targets for predictive services that use your trained models.

These compute targets can be used to host models for deployment, for example, Azure Kubernetes Service cluster

Automated machine learning

This feature enables non-experts to quickly create an effective machine learning model from data.

Automated machine learning capability that automatically tries multiple pre-processing techniques and model-training algorithms in parallel.

Automated machine learning allows you to train models without extensive data science or programming knowledge.

For people with a data science and programming background, it provides a way to save time and resources by automating algorithm selection and hyperparameter tuning.

AutoML process

Prepare data: Identify the features and label in a dataset. Pre-process, or clean and transform, the data as needed.

Train model: Split the data into two groups, a training and a validation set. Train a machine learning model using the training data set. Test the machine learning model for performance using the validation data set.

Evaluate performance: Compare how close the model's predictions are to the known labels.

Deploy a predictive service: After you train a machine learning model, you can deploy the model as an application on a server or device so that others can use it.

Prepare data

Machine learning models must be trained with existing data. Data scientists expend a lot of effort exploring and pre-processing data, and trying various types of model-training algorithms to produce accurate models, which is time consuming, and often makes inefficient use of expensive compute hardware.

In Azure Machine Learning, data for model training and other operations is usually encapsulated in an object called a *dataset*. You can create your own dataset in Azure Machine Learning studio.

Metric score threshold

Concurrency

Max concurrent iterations [i](#)

2

Train model

Evaluate performance

A technique called *cross-validation* is used to calculate the evaluation metric. After the model is trained using a portion of the data, the remaining portion is used to iteratively test, or cross-validate, the trained model. The metric is calculated by comparing the predicted value from the test with the actual known value, or label.

Deploy a predictive service

In Azure Machine Learning, you can deploy a service as an Azure Container Instances (ACI) or to an Azure Kubernetes Service (AKS) cluster.

For production scenarios, an AKS deployment is recommended

Azure Machine Learning designer

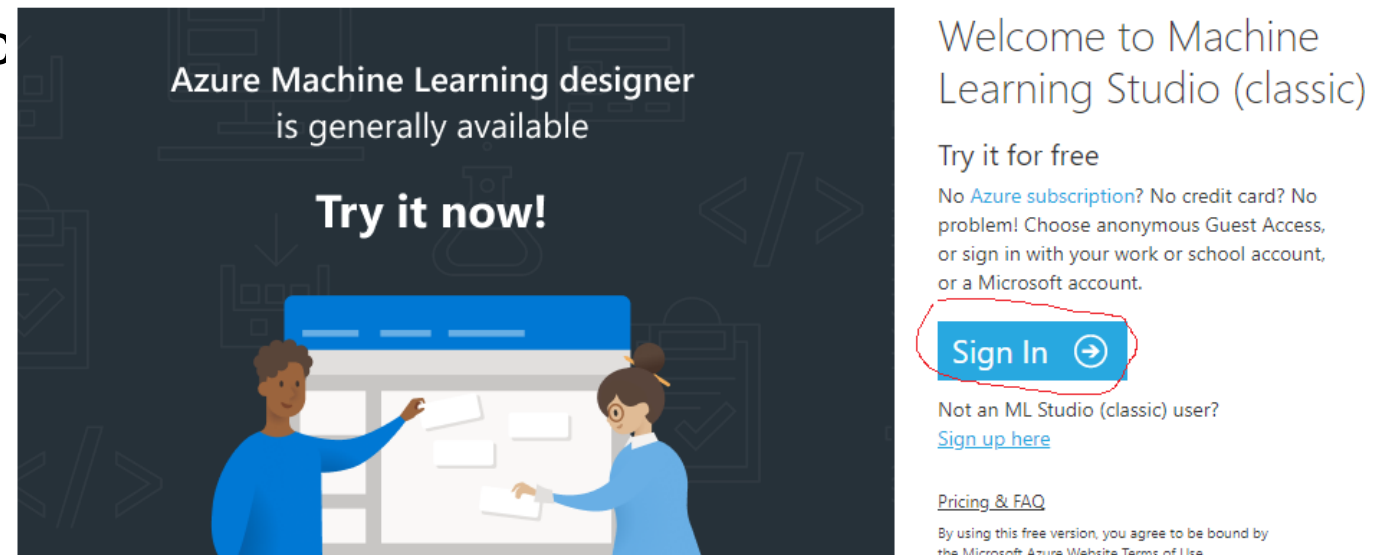

A graphical interface enabling no-code development of machine learning solutions.

Data and compute management

Cloud-based data storage and compute resources that professional data scientists can use to run data experiment code at scale.

Pipeline

Data scientists, software engineers, and IT operations professionals can define pipelines to orchestrate model training, deployment, and management tasks.

Understand anomaly detection

Imagine you're creating a software system to monitor credit card transactions and detect unusual usage patterns that might indicate fraud.

An application that tracks activity in an automated production line and identifies failures.

A racing car telemetry system that uses sensors to proactively warn engineers about potential mechanical failures before they happen.

<https://docs.microsoft.com/en-us/learn/wwl-data-ai/get-started-ai-fundamentals/media/anomaly-detection.gif>

Understand computer vision

Computer Vision is an area of AI that deals with visual processing. [Seeing AI](#)

Image classification

Object detection

Semantic segmentation

Image analysis

Face detection, analysis, and recognition

Optical character recognition (OCR)

Image classification

Image classification involves training a machine learning model to classify images based on their contents. For example, in a traffic monitoring solution you might use an image classification model to classify images based on the type of vehicle they contain, such as taxis, buses, cyclists, and so on.

Object detection

Object detection machine learning models are trained to classify individual objects within an image and identify their location with a bounding box. For example, a traffic monitoring solution might use object detection to identify the location of different classes of vehicle.

Semantic segmentation

Semantic segmentation is an advanced machine learning technique in which individual pixels in the image are classified according to the object to which they belong. For example, a traffic monitoring solution might overlay traffic images with "mask" layers to highlight different vehicles using specific colors.

Image analysis

You can create solutions that combine machine learning models with advanced image analysis techniques to extract information from images, including "tags" that could help catalog the image or even descriptive captions that summarize the scene shown in the image.

Face detection, analysis, and recognition

Face detection is a specialized form of object detection that locates human faces in an image. This can be combined with classification and facial geometry analysis techniques to infer details such as age and emotional state; and even recognize individuals based on their facial features.

Optical character recognition (OCR) |

Optical character recognition is a technique used to detect and read text in images.

Computer vision services in Microsoft Azure

Computer Vision--You can use this service to analyze images and video, and extract descriptions, tags, objects, and text.

Custom Vision--Use this service to train custom image classification and object detection models using your own images.

Face--The Face service enables you to build face detection and facial recognition solutions.

Form Recognizer-- Use this service to extract information from scanned forms and invoices.

Developed an AI based Mobile
Application to identify Indian Currency

This app can be helpful for the visually
impaired people to recognize currency
notes

Natural language processing

Natural language processing (NLP) is the area of AI that deals with creating software that understands written and spoken language

- Analyze and interpret text in documents, email messages, and other sources.
- Interpret spoken language and synthesize speech responses.
- Automatically translate spoken or written phrases between languages
- Interpret commands and determine appropriate actions.

Example

Starship Commander, is a virtual reality (VR) game from Human Interact, that takes place in a science fiction world. The game uses natural language processing to enable players to control the narrative and interact with in-game characters and starship systems.

<https://www.microsoft.com/en-us/videoplayer/embed/RE4vyDj?postJsllMsg=true>

Natural language processing in Microsoft Azure

In Microsoft Azure, you can use the following cognitive services to build natural language processing solutions:

Text Analytics: Use this service to analyze text documents and extract key phrases, detect entities (such as places, dates, and people), and evaluate sentiment (how positive or negative a document is)

Translator Text: Use this service to translate text between more than 60 languages.

Speech: Use this service to recognize and synthesize speech, and to translate spoken languages

Language Understanding Intelligent Service (LUIS): Use this service to train a language model that can understand spoken or text-based commands

<https://aidemos.microsoft.com/luis/demo>

Conversational AI

Conversational AI is the term used to describe solutions where AI agents participate in conversations with humans

Conversational AI solutions use *bots* to manage dialogs with users.

These dialogs can take place through web site interfaces, email, social media platforms, messaging systems, phone calls, and other channels.

Where we can use

Customer support for products or services.

Reservation systems for restaurants, airlines, cinemas, and other appointment-based businesses.

Health care consultations and self-diagnosis.

Home automation and personal digital assistants

<https://www.microsoft.com/en-us/videoplayer/embed/RE4vC2P?postJsllMsg=true>

Conversational AI in Microsoft Azure

QnA Maker

Azure Bot Service

QnA Maker

This cognitive service enables you to quickly build a *knowledge base* of questions and answers that can form the basis of a dialog between a human and an AI agent.

QnA service can only retrieve answers from the Knowledgebase, nothing else. You can think it as a fancier Database, you can query it using human language.

Azure Bot Service

This service provides a platform for creating, publishing, and managing bots.

Developers can use the *Bot Framework* to create a bot and manage it with Azure Bot Service - integrating back-end services like QnA Maker and LUIS, and connecting to channels for web chat, email, Microsoft Teams, and others.

<https://www.microsoft.com/en-us/research/project/health-bot/>

Practice Questions ?

You want to create a model to predict sales of ice cream based on historic data that includes daily ice cream sales totals and weather measurements. Which Azure service should you use?

- A.
Azure Machine Learning
- B.
QnA Maker
- C.
Text Analytics

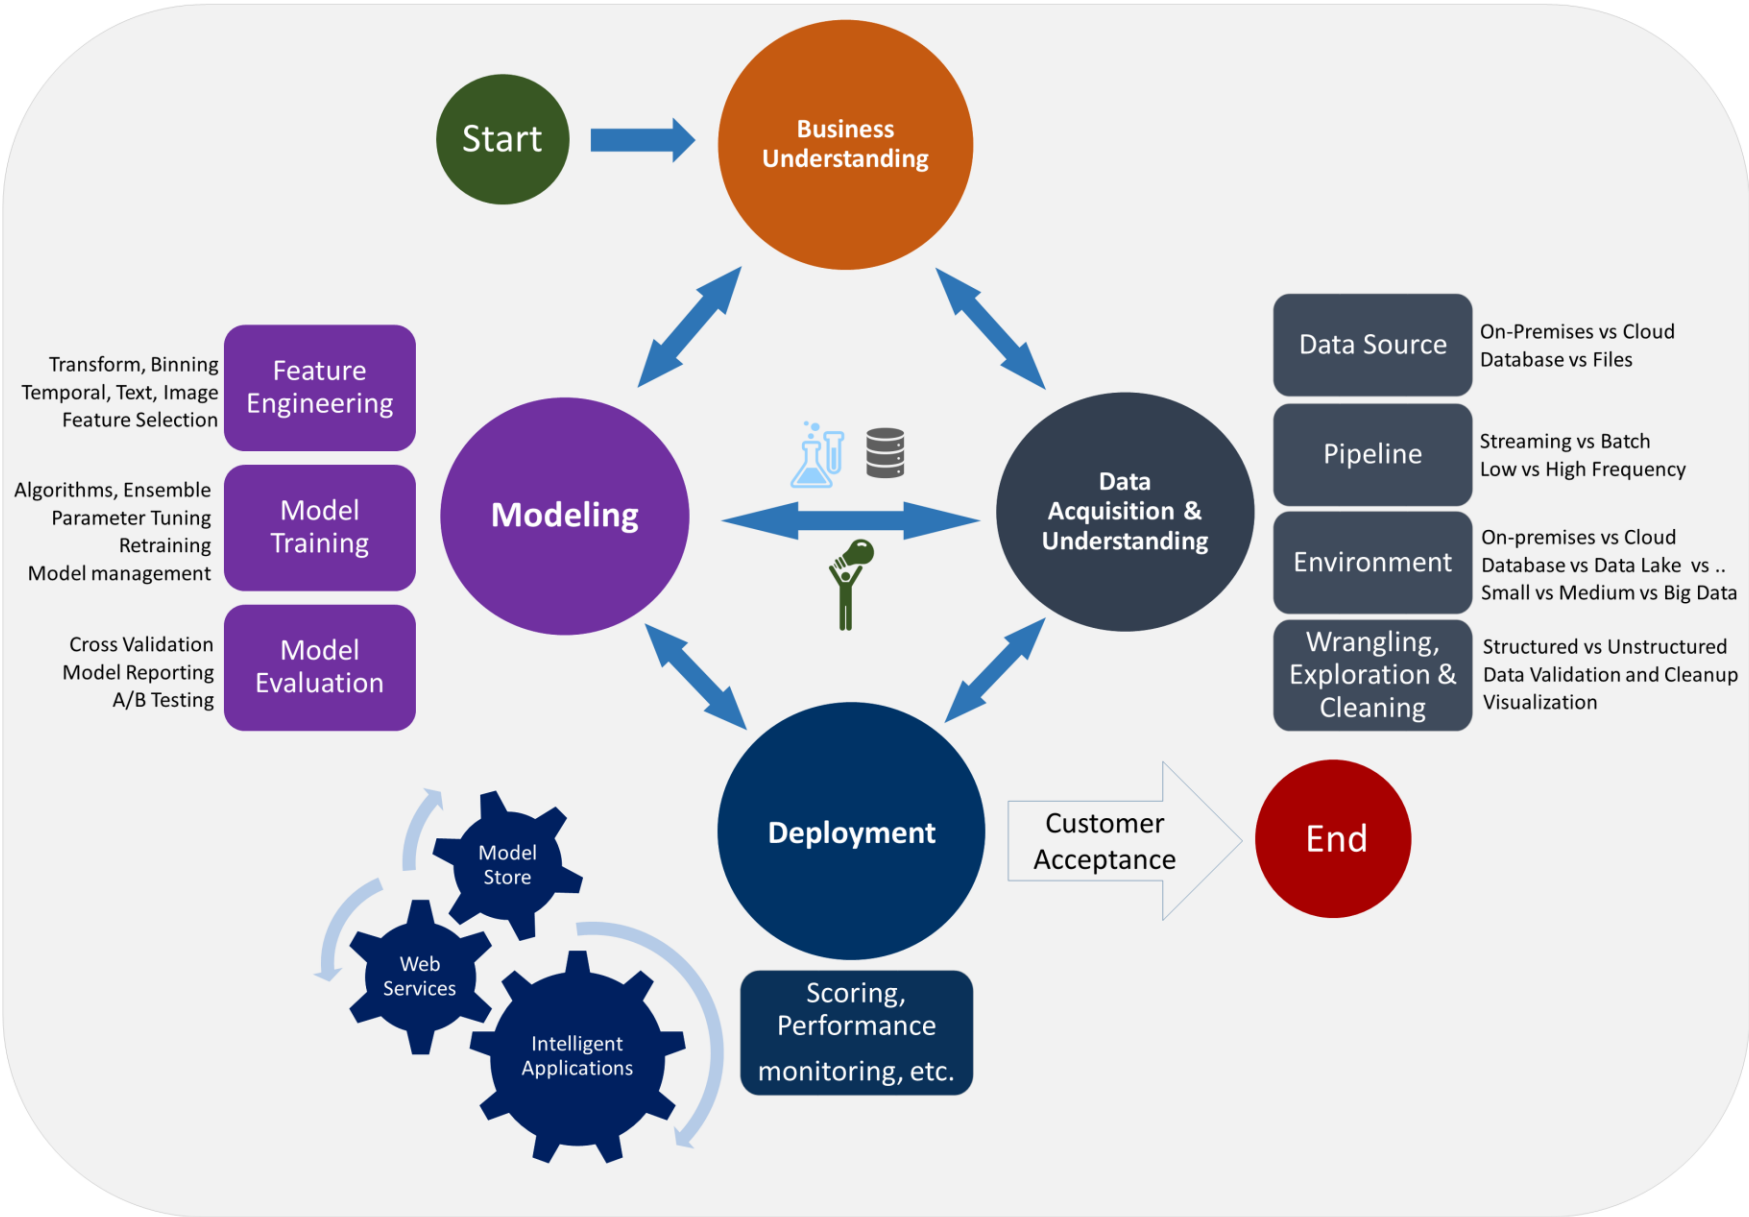

You want to train a model that classifies images of dogs and cats based on a collection of your own digital photographs. Which Azure service should you use?

- A. Computer Vision
- B. Custom Vision
- Azure Bot Service

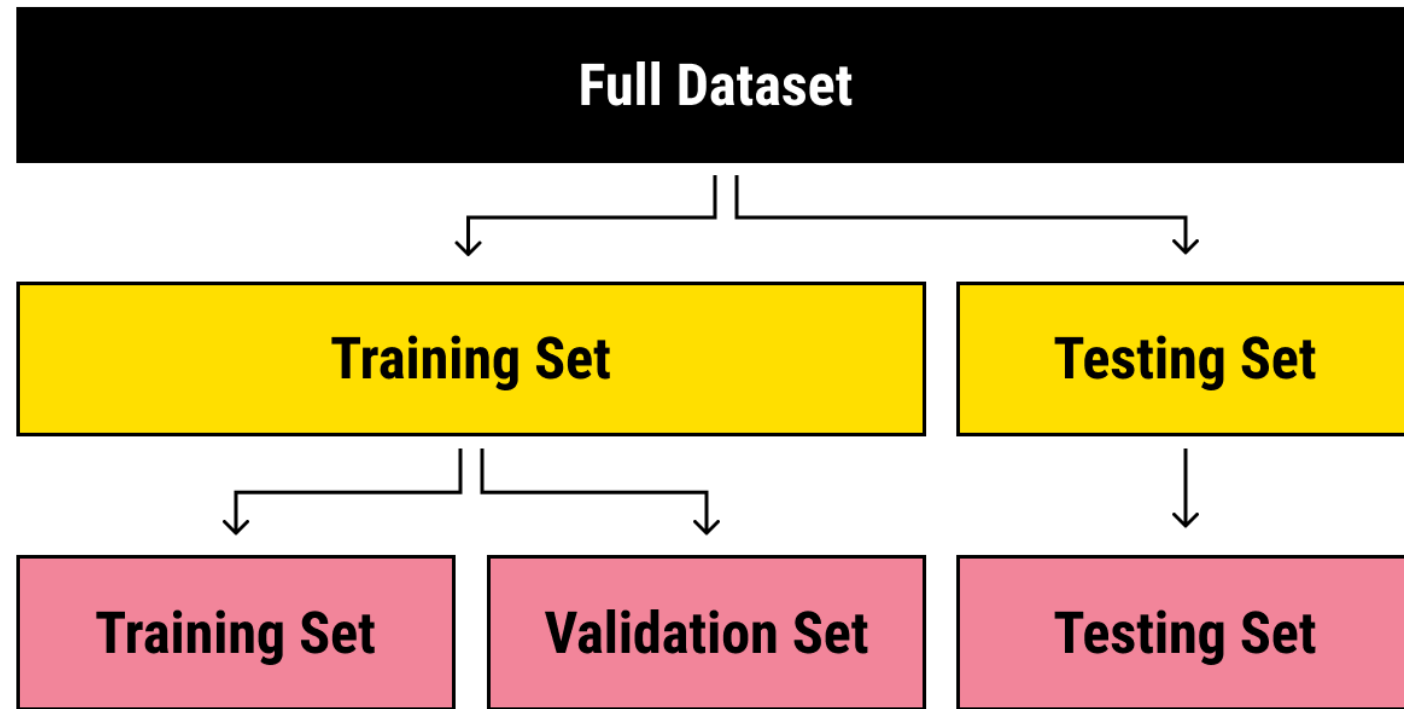

You are designing an AI application that uses computer vision to detect cracks in car windshields, and warns drivers when a windshield should be repaired or replaced. When tested in good lighting conditions, the application successfully detects 99% of dangerously damaged glass. Which of the following statements should you include in the application's user interface?

- A. When used in good lighting conditions, this application can be used to identify potentially dangerous cracks and defects in windshields. If you suspect your windshield is damaged, even if the application does not detect any defects, you should have it inspected by a professional.
- B. This application detects damage in your windshield. If the application detects a defect, have the windshield replaced or repaired. If no defect is detected, you're good to go!
- C. This application detects damage in any glass surface, but you must accept responsibility for using it only in appropriate lighting conditions.

Data Science Lifecycle

Data Split

What is a Model

Challenges in AI

Bias – Amazon recruitment tool bias against women

Errors – Autonomous vehicle may face collision

Data could be exposed – Medical chat bot may expose sensitive patient data

Solutions may not work for everyone - App without audio

Users must trust a complex system – AI model/system should be user friendly

Who is liable for AI driven systems? - Suspecting an innocent as a criminal based on FR

Principals of Responsible AI

Fairness

Reliability & Safety

Privacy & Security

Inclusiveness

Transparency

Accountability

[Responsible AI](#)

Fairness

AI systems should treat all people fairly

Azure Machine Learning includes the capability to interpret models and quantify the extent to which each feature of the data influences the model's prediction.

This capability helps data scientists and developers identify and mitigate bias in the model.

<https://www.microsoft.com/en-us/videoplayer/embed/RE4vqfa?postJsllMsg=true>

Fairness

suppose you create a machine learning model to support a loan approval application for a bank. The model should predict whether the loan should be approved or denied without bias.

This bias could be based on gender, ethnicity (region), or other factors that result in an unfair advantage or disadvantage to specific groups of applicants.

Reliability & Safety

AI systems should perform reliably and safely.

For example, consider an AI-based software system for an autonomous vehicle; or a machine learning model that diagnoses patient symptoms and recommends prescriptions. Unreliability in these kinds of system can result in substantial risk to human life.

AI-based software application development must be subjected to rigorous testing and deployment management processes to ensure that they work as expected before release.

<https://www.microsoft.com/en-us/videoplayer/embed/RE4vvl?postJsllMsg=true>

Privacy & Security

AI systems should be secure and respect privacy.

The machine learning models on which AI systems are based rely on large volumes of data, which may contain personal details that must be kept private. Even after the models are trained and the system is in production, it uses new data to make predictions or take action that may be subject to privacy or security concerns.

<https://www.microsoft.com/en-us/videoplayer/embed/RE4voJF?postJsllMsg=true>

Inclusiveness

AI systems should empower everyone and engage people.

AI should bring benefits to all parts of society, regardless of physical ability, gender, sexual orientation, ethnicity, or other factors.

<https://www.microsoft.com/en-us/videoplayer/embed/RE4vl9v?postJsllMsg=true>

Transparency

AI SYSTEMS SHOULD BE UNDERSTANDABLE.

USERS SHOULD BE MADE FULLY AWARE OF THE PURPOSE OF THE SYSTEM, HOW IT WORKS, AND WHAT LIMITATIONS MAY BE EXPECTED.

[TTPS://WWW.MICROSOFT.COM/EN-US/VIDEOPLAYER/EMBED/RE4VQFB?POSTJSLLMSG=TRUE](https://www.microsoft.com/en-us/VIDEOPLAYER/EMBED/RE4VQFB?POSTJSLLMSG=TRUE)

Accountability

People should be accountable for AI systems.

Designers and developers of AI-based solution should work within a framework of governance and organizational principles that ensure the solution meets ethical and legal standards that are clearly defined.

<https://www.microsoft.com/en-us/videoplayer/embed/RE4vvlk?postJsllMsg=true>
